I. INTRODUCTION

This volume is the fifty-ninth annual vital statistics report of the State of North Carolina.

The computer information system underlying the automated report is depicted in the flow diagram on the previous page. The computer-based system has resulted in increased flexibility in information retrieval and more timely dissemination of vital statistics. This system usually permits publication of vital statistics during the month of April in the following calendar year.

This report shows annual frequencies and rates and five-year rates for total, white and nonwhite selected vital events by each county and major incorporated city in North Carolina. The vital statistics for a city, a county or the State are together in one table on a single page. The cities and counties are in alphabetical sequence. Trends in State data are discussed in Section II.

Beginning with the years 1971-73, the publication North Carolina

Vital Statistics, Volume 2 examines leading causes of death for counties, four regions and the State. This volume, which includes mapping of actual and agerace-sex-adjusted county rates for total mortality, infant mortality and 25 specific causes of mortality, will be repeated every three years. In addition, interim reports of tabular data will be prepared on an annual basis. An auxiliary report entitled Detailed Mortality Statistics enumerates State and county annual deaths classified according to the specific causes of death and the age, race and sex of decedents. We hope that together these reports will serve your needs.

II. TRENDS IN VITAL STATISTICS

North Carolina's population and vital record registrations in recent years reflect the following trends:

NET MIGRATION "IN" FOR WHITES, "OUT" FOR NONWHITES

CRUDE BIRTH RATE LOWEST EVER; ILLEGITIMACY CONTINUES UPWARD

INFANT MORTALITY REDUCED BY 20% SINCE 1970;
NONWHITE POSTNEONATAL MORTALITY DOWN BY 31%

DEATH RATE DROPS; EXCESSIVE MALE AND NONWHITE MORTALITY CONTINUES

MARRIAGE RATE DECLINES; DIVORCE RATE CONTINUES UPWARD

Expanded analyses of these trends follow. These analyses are based on annual vital record registrations and population bases applicable to July 1 of the registration year. The population bases for 1973 and 1974 are described in Section V. For all other years 1960-1972, population bases represent straight-line interpolations or extrapolations of the 1960 and 1970 Censuses (1, 2). The reader will note that alternate bases for 1971 and 1972, described in Section V, were used in the calculation of the five-year rates of this report. The straight-line extrapolations were maintained for the trend analyses in order that rates conform exactly to those depicted in the 1971 and 1972 annual vital statistics reports.

In the analyses which follow, the several statistics are discussed in the order of their appearance in the tables of this report. Counties and cities may review their respective vital statistics trends in order to detect departures from the State trends. For definitions and formulas, see Section VII.

Population: NET MIGRATION "IN" FOR WHITES, "OUT" FOR NONWHITES

Between 1960 and 1970, the North Carolina population increased by 526,000 persons, an 11.5% increase over the 1960 Census. The nationwide increase was slightly higher, 13.3%. North Carolina whites increased by 14% and nonwhites by 3%. The urban population increased by 27% while the rural population increased by 1.5%. (2)

Both whites and nonwhites experienced net outmigration during the nineteen-fifties, but whites netted an in-migration of 97,950 persons (+2.9%) between 1960 and 1970. Outmigration of nonwhites remained high. The net was 170,752 persons (-14.8%).

In-migration of whites and outmigration of nonwhites lowered the percentage of nonwhites in the population from 25.4 in 1960 (1) to 23.2 in 1970 (2). The reduction has been delimited by a higher rate of natural increase among nonwhites. In 1974, natural increase per 1,000 population was 5.7 for whites, 12.0 for nonwhites and 7.1 for all races combined.

Live Births: CRUDE BIRTH RATE LOWEST EVER; ILLEGITIMACY CONTINUES UPWARD

The North Carolina birth rate was 15.7 resident births per 1,000 population in 1974. This was the lowest birth rate ever recorded in North Carolina, down 19 percent since 1970 when the rate was 19.3. The white birth rate was 17.8 in 1970 compared to 13.9 in 1974. For nonwhites, the rate was 24.4 in 1970 and 21.9 in 1974.

The percentage of resident live births attended by a physician was 99.6 in 1974 compared to 99.1 in 1970. The trend for hospital births has also been upward, from 98.5 percent in 1970 to 99.1 percent in 1974.

The percentage of births classified as premature, 5 pounds 8 ounces or less, was 8.6 in 1974 compared to 8.7 in 1973. The percentages were 8.8 in 1960 and 9.2 in 1970. The nonwhite premature rate is nearly two times the white premature rate.

The percentage of births classified as illegitimate was 15.0 in 1974 compared to 14.7 in 1973 and 12.6 in 1970. The nonwhite illegitimacy rate is nearly ten times the white illegitimacy rate.

Fetal and Infant Mortality: INFANT MORTALITY REDUCED BY 20% SINCE 1970; NONWHITE POSTNEONATAL MORTALITY DOWN BY 31%

In 1974 the North Carolina perinatal mortality rate was 28.0 resident deaths per 1,000 deliveries. The rate continued a declining trend in perinatal mortality. The perinatal mortality rate was 30.6 in 1973 and 33.8 in 1970. Reductions in perinatal mortality have occurred primarily in the nonwhite segment of the population.

The North Carolina fetal mortality rate was 14.1 deaths per 1,000 deliveries in 1974 compared to 15.2 in 1973 and 14.8 in 1972. The white fetal mortality rate was 11.2 in 1974; the nonwhite rate was 20.5. Comparisons to fetal mortality rates observed prior to 1972 are precluded by 1971 changes in the North Carolina abortion law (G.S. 14-45.1) whereby fetal deaths of 20 or more weeks gestation may be reportable as therapeutic abortions.

The North Carolina neonatal mortality rate was 14.1 deaths per 1,000 live births in 1974. In 1970, the neonatal mortality rate was 17.9. The white neonatal mortality rate was 15.3 in 1970 and 12.3 in 1974. The nonwhite neonatal mortality rate was 24.1 in 1970 compared to 17.8 in 1974.

The North Carolina postneonatal mortality rate was 5.4 deaths per 1,000 neonatal survivors in 1974. A downward trend in postneonatal mortality gained impetus in 1967. The white postneonatal mortality rate was 4.0 in 1970, 3.9 in 1971, increased to 4.5 in 1973 and dropped to 4.1 in 1974. The nonwhite postneonatal mortality rate declined from 12.0 in 1970 to 11.0 in 1971, increased to 11.5 in 1972 and dropped to 8.3 in 1974.

The North Carolina infant mortality rate in 1974 was 19.4 deaths per 1,000 live births. This rate represents a decrease of 20 percent since 1970 when the rate was 24.1. The white infant mortality rate was 19.2 in 1970 and 16.4 in 1974. The nonwhite infant mortality rate was 35.8 in 1970 and 26.0 in 1974. The United States also continues to experience reductions in infant mortality (3).

Deaths: DEATH RATE DROPS; EXCESSIVE MALE AND NONWHITE MORTALITY CONTINUES

The North Carolina death rate was 8.6 resident deaths per 1,000 population in 1974, down 5 percent from a rate of 9.1 recorded in 1972 and 1973. The male rate of 10.1 compares to a female rate of 7.2. The death rate was 21 percent higher for nonwhites than for whites. The white and nonwhite death rates were 8.2 and 9.9 respectively. Both sexes and races contributed substantially to the five percent decline between 1973 and 1974.

For all age categories, the nonwhite rate was higher than the white rate. A nonwhite child 0-4 years of age was nearly twice as likely to die as a white child of the same age. A nonwhite adult 25-44 years of age was nearly three times as likely to die as the white adult in the age group.

Approximately three out of five resident deaths occurred in a hospital in 1974. Less than four percent of the deaths which occurred in North Carolina were to nonresidents of the State.

Other Events: MARRIAGE RATE DECLINES; DIVORCE RATE CONTINUES UPWARD

The North Carolina marriage rate declined in 1974 to 8.4 marriages per 1,000 population. The rate was 9.0 in 1973 and 9.4 in 1972. In 1962, when marriage registration began, the rate was 7.3. The provisional United States rate of 10.5 in 1974 represented the first national decline since 1958 (3).

The North Carolina divorce rate was 3.7 divorces per 1,000 population in 1974, up 37 percent from a rate of 2.7 in 1970. The rising divorce rate for the United States was estimated at 4.6 in 1974 (3).

The North Carolina divorce rate accelerated after 1964 when one-year separations replaced two-year separations as grounds for divorce. In the United States, the divorce rate began rising in 1963 (3).

III. REGISTRATION OF VITAL EVENTS

The origin, flow and disposition of North Carolina vital records are illustrated in the flow diagram on page 1-8. A brief history of vital records processing in North Carolina and current registration practice are discussed below. The user of this report may note in particular the section regarding registration of fetal deaths. Legislation enacted by the 1971 North Carolina General Assembly has altered fetal death registration practice.

Birth and Death

The Bureau of Vital Statistics, with the State Health Director as State Registrar of Vital Statistics, was created by an act of the General Assembly of 1913. The 1973 General Assembly changed the name of the office to the Department of Human Resources and made the Secretary of Human Resources the State Registrar of Vital Statistics. The authority of this department and the laws which it administers are contained in Chapter 130, Article 7, of the General Statutes of North Carolina. Within the organizational structure of the Department of Human Resources, the duties of the State Registrar of Vital Statistics are accomplished primarily by the Vital Records Branch with support from the Public Health Statistics Branch.

The collection of birth and death records began on October 1, 1913. The Department of Human Resources is the custodian of these records. Statutes enacted by the General Assembly of 1913 require that physicians, midwives, or other persons attending a birth file a birth certificate within five days after birth. The funeral director or person burying a body is responsible for filing a death certificate or fetal death certificate with the local registrar prior to final disposition and within 72 hours after death.

- vorces. - Performs selective edit of variables for
- published data.
- Summarizes data by county and city for verification of computer output.

NATIONAL CENTER FOR HEALTH STATISTICS

Receives microfilm copies from states. Codes cause of death by current revision of ICDA.

Publishes United States reports. Provides technical assistance.

Provides classes in registration (ASTI).

DTHER STATES

Exchange vital records.

The local registrar is the health director in 97 of 100 counties.

A clerk of the county health department, designated by the local registrar as deputy registrar, carries out registration procedures locally. The deputy registrar forwards the original birth and death certificate to the Department of Human Resources on the fifth day of the month following the event, where they are processed and permanently preserved. Periodically, birth and death certificates are microfilmed and sent to the National Center for Health Statistics.

North Carolina was admitted into the National Death Registration Area in 1916 and into the National Birth Registration Area in 1917.

Fetal Death

Prior to May 19, 1971, North Carolina law required the filing of a fetal death certificate for fetal deaths (stillbirths) of 20 or more weeks gestation. Legislation enacted by the 1971 General Assembly (G.S. 14-45.1) requires that therapeutic abortions be reported separately. For fetal deaths falling within the purview of the referenced statute, the therapeutic abortion report form now serves in lieu of a fetal death certificate. For this reason, counts of fetal deaths and perinatal deaths in 1971 through 1974 are not strictly comparable to counts in previous years. In 1974, approximately 288 fetal deaths of 20 or more weeks gestation were preferentially reported as therapeutic abortions.

Marriage and Divorce

In 1957, the General Assembly enacted legislation requiring that the duties of the clerk of court include the registration of divorces and

annulments of marriage effective January 1, 1958. Lists of divorces and annulments are required to be sent to the Department of Human Resources on or before the 15th day of the month following the event.

By virtue of legislation enacted in 1961, the duties of the county register of deeds include the registration of marriages occurring on or after January 1, 1962. Copies of the certificates of marriage are required to be forwarded to the Department of Human Resources on or before the 15th day of the month following the marriage. The original certificates are filed with the county registers of deeds.

In January 1964, North Carolina was admitted to the National Marriage Registration Area. North Carolina is not a member of the National Divorce Registration Area.

IV. TECHNICAL NOTES

Completeness of Registration of Vital Events

Completeness of registration is defined as the degree to which reported vital event enumerations agree with the true counts in a given time frame. Birth registration, tested for completeness in 1940 and 1950, was found to be 86 and 96 percent complete respectively (4). Death registration is believed to be even more complete than birth registration.

Marriage registration was tested for completeness in 1963. Over 99 percent of performed marriages terminated in properly recorded certificates of marriage (5).

Delayed registration results in underenumeration of vital events for a specific time period. Frequency counts in this report are based on 1974 events filed with the local registrar prior to March 1, 1975 and processed in the State office before the end of March 1975. Based on examinations of lagtimes in prior years, the number of calendar year events filed after March 1 of the subsequent year is considered negligible. As this publication goes to press, 19 birth and 19 death records for 1974 were processed during April and not added to the statistical file. These residuals are considered amongst the 0.2 - 0.5% which will accrue during 1975.

Accuracy of Items on Certificates

The Vital Records Branch maintains continuous surveillance of certificates to detect inconsistencies in related items (e.g., newborn's name vs. sex). However, the true extent of bias and unreliability due to incorrect answers is not known.

Treatment of Missing Values

As a result of a query program to reconcile inconsistencies in the data and to complete unanswered items, missing values are rare for the characteristics included in this report. These "not stated" cases are treated in one of two ways:

- not allocated because they are believed to have an unknown distribution which is different from the distribution for "stated" cases;
- (2) randomly distributed in the same proportion as the "stated" cases for the State.

The following table shows the number and treatment of missing values for the statistics found in the detailed tables.

NUMBER OF MISSING VALUES BY ITEM AND TREATMENT NORTH CAROLINA, 1974

Item		Missing Values Treatment 2
LIVE BIRTHS Birth Weight Legitimacy	42 2	0 0
DEATHS Race	0	7

Residence Allocation

Except as otherwise indicated, vital events in this report are allocated to the place of residence (county or city) regardless of the place of occurrence. In the case of a birth or fetal death, residence is the usual residence of the mother. Deaths are allocated to the residence of the deceased.

Prior to July 1972, North Carolina participated in an interchange program whereby photocopies of non-resident birth and death certificates were sent to the National Center for Health Statistics which acted as a broker service. In July 1972, as a result of a resolution passed by the American Association of Vital Records and Public Health Statistics (AAVRPHS), North Carolina joined with other states in a direct interchange of non-resident records. The records are sent to the state of residence within two months of the date of occurrence. The National Center for Health Statistics acts as a control for this interchange through a report from each state which lists the number of each type of vital record sent to every other state.

Occurrence Allocation

Items 7 and 16 of the tables allocate live births and deaths respectively to place of occurrence regardless of place of residence.

Marriage and divorce data are compiled by place of occurrence—county of license for marriages and county of decree for divorces and annulments.

Marriage and divorce statistics are not available for cities.

Race or Color Allocation

Two broad categories, "white" and "nonwhite," are used in this report. Nonwhite is predominantly Negro (95%) in North Carolina (2). For births and fetal deaths, where one parent is classified as white and the other nonwhite, the child is classified as nonwhite.

V. POPULATION BASES

Population bases for the five-year rates are averages of population bases applicable to July 1 of each of the years 1970-1974. Methodologies for the annual bases are as follows:

1970: Straight-line extrapolations of the 1960 and 1970 Censuses specific for race, sex and 10-year age categories (1, 2), i.e., the April 1, 1970 Census counts advanced to July 1, 1970;

1971-1974: Modified ratio-projections (6) based on the 1960 and 1970 Censuses specific for race, sex and five-year age categories (1, 2) with county projections subsequently adjusted to sum to independent county estimates (7-9); city projections are not so adjusted.

The 1971-1974 population bases were provided by the Office of State Planning of the North Carolina Department of Administration. They are derived from a ratio-projection procedure developed by Hamilton and Perry and modified by the Research Triangle Institute. Details concerning the projection program, its operation and options are given by Benrud (6).

Persons interested in trend analyses of vital statistics rates should note that the population bases described above are not the arithmetic straight-line series used in North Carolina vital statistics reports in years prior to 1973. While it was felt that availability of more accurate methods precluded our continuing use of the straight-line procedure, the change in series may result in some hardship in terms of trend analysis, verily as the different

methodologies produce widely disparate population bases in some cases. Some population bases and the corresponding rates are minimally affected by the change; for example, the 1971 and 1972 total and race-specific rates for the State differ by no more than one-tenth per 1,000 when rates based on straight-line projections are compared to rates based on the new population bases for these years. For some smaller population sectors, however, rates based on the two different population series vary to a much larger extent. Thus, in order to achieve comparability in rates throughout the decade of the seventies, persons involved in trend analysis should re-compute rates for 1971 and 1972. The age-race-sex-specific population bases required for these computations are available in published form for the State and for each county (10); population projections for the thirty-eight cities included in this report can also be provided (11, 12).

VI. RATES

Computation

The relative frequency with which a vital event occurs is expressed in the rates computed in this report. Rates are simple ratios of two numbers which represent population enumerations for a given time period. For annual rates, the numerators in these ratios are vital event enumerations and the denominators represent related vital event enumerations or population projections for the calendar year. For the five-year rates, the numerators in the ratios are the average numbers of vital event enumerations and the denominators are the average numbers of related vital event enumerations or the average population bases for the five-year period. In some cases, the numerators are proper subsets of the denominator; usually these rates are expressed as percentages. Other rates are expressed in terms of 1,000 related events of population. For example, the crude birth rate is expressed as "the number of live births per 1,000 population."

Careful examination of the definitions of the rates computed in this report will reveal that many are true proportions whose decimal has been moved two or three places to the right for convenience of expression. For example, the "premature rate" and "illegitimate rate" are true proportions expressed as percentages. Other rates may not represent true proportions. For example, the crude death rate and the age-specific death rates may not, although these rates may be satisfactory estimates of empirical or a posteriori probabilities when the decimal is moved three

places to the left. The reason the death rates may not represent true proportions is that the denominators are population bases applicable to July 1 of each year and hence do not represent the true population exposed to the risk of dying during the entire year. On the other hand, the rate of natural increase (when divided by 1,000) is neither a true proportion nor does it represent an estimate of either a true proportion or an empirical probability.

Rates are rounded to one decimal place for publication. Except for marriage and divorce events for which race-specific rates are not calculated, a blank in the rate column indicates that both the numerator and the denominator are zero. A rate of 0.0 is shown for rates less than 0.05.

Interpretation

Inaccurate reporting, underregistration and missing values have been discussed (Section IV). These factors affect the validity of items of information involved in rate computation. The user of vital statistics measures should be aware of these possible limitations.

One should interpret with caution rates which are based on small frequencies since sampling error may be large. In this regard, Grove and Hetzel (13) point out:

Whether or not a rate is statistically reliable in terms of its sampling error depends upon the purpose for which it is to be used. A large sampling error may not be serious where the rates to be compared differ greatly. However, if the differences among the rates are small, only small sampling errors can be permitted.

Due to the fact that small numbers of events may be associated with relatively large chance fluctuations in rates, five-year rates are included to add stability to those annual rates which involve small numbers. Based on an increased number of events, these average annual rates are associated with reductions in possible error.

In comparing rates, one must carefully examine the various factors to which a difference in rates might be attributed. Unless the populations are equivalent in all factors except the one for which the comparison is made, conclusions about differences in rates may not be clearly drawn. Age-adjusted rates or other further analyses may be necessary in order to make valid comparisons.

VII. DEFINITIONS AND FORMULAS

Formulas given in this section represent computing procedures for the rates of this report. Formulas for the annual rates are of the form

$$\frac{E}{D}$$
 X 1000

where E represents vital event enumerations for the calendar year and P represents related vital events or the population base for the calendar year.

For each corresponding five-year rate, the average number of vital events for the five-year period is divided by the average number of related vital events or the average population base for the five-year period. The computing formula for the five-year rate is:

$$\frac{1/5 (E_1 + E_2 + E_3 + E_4 + E_5)}{1/5 (P_1 + P_2 + P_3 + P_4 + P_5)} \times 1000$$

Definitions and formulas for the rates are described below in the numerical order of their appearance in the tables.

1. Population

The population of an area is the expected population of that area as of July 1 of the event year. The population figures shown in the tables are summations over race-sex-age-specific population bases described in Section V.

Computations are the area population as a percentage of the total North Carolina population and the percentage distribution of the area population according to sex.

$$\begin{array}{c} \text{Percentage of N. C. population} \\ \text{residing in area} \end{array} = \frac{\text{Population of area}}{\text{Population of North Carolina}} \hspace{0.1cm} \hspace{0$$

2. Natural Increase

Natural increase is the excess of births over deaths among residents of an area. The rate is per 1000 population of the area.

Rate of natural increase =
$$\frac{\text{Number of live births}}{\text{Population of area}} \times 1000$$

3. Live Births

A live birth is the complete expulsion or extraction from its mother of a product of conception, irrespective of the duration of pregnancy, which, after such separation, breathes or shows any other evidence of life, such as beating of the heart, pulsation of the umbilical cord, or any definite movement of voluntary muscles, whether or not the umbilical cord has been cut or the placenta is attached. (Definition adopted by World Health Organization in 1950.)

Birth rates are computed for total, male and female resident live births.

Birth rate (crude) =
$$\frac{\text{Number of live births}}{\text{Population of area}}$$
 X 1000

Male birth rate = $\frac{\text{Number of male live births}}{\text{Population of area}}$ X 1000

Female birth rate = $\frac{\text{Number of female live births}}{\text{Population of area}}$ X 1000

4. Attendant

Computations are the percentage distribution of resident live births according to attendant at birth.

Percentage of live births attended by physician in hospital =
$$\frac{\text{Number of live births attended by physician in hospital}}{\text{Number of live births}} \times 100$$

Percentage of live births attended by physician not in hospital =
$$\frac{\text{Number of live births attended by physician not in hospital}}{\text{Number of live births}} \times 100$$

Percentage of live births attended by midwife and other =
$$\frac{\text{Number of live births attended by midwife and other}}{\text{Number of live births}} \times 100$$

5. Premature Births

In this report, a premature birth is defined as a live born infant weighing 2500 grams (5 pounds, 8 ounces) or less at birth, regardless of the period of gestation. (Birth weight index recommended by the Expert Group on Prematurity of the World Health Organization, 1950.)

The "premature rate" is the percentage of total resident live births which were premature. Missing values (not stated birth weights) are

not excluded from the denominator since the number of such events is relatively small (42 cases for the State as a whole).

Premature rate specific for live births = Number of premature live births X 100

6. Births Out of Wedlock

An illegitimate birth is one which occurs to a woman who has never been legally married or who has been widowed or legally divorced from her husband in excess of 280 days (14). The "illegitimate rate" is the percentage of total resident live births which occurred out of wedlock.

Illegitimate rate specific for live births = $\frac{\text{Number of live births}}{\text{Number of live births}} \times 100$

7. Occurrence Births

Live births occurring in an area are shown as a percentage of total live births occurring in the State. Live births occurring in the area to residents of the area are shown as a percentage of the total live births occurring in the area. Complementary totals (i.e., non-resident births occurring in area and resident births occurring elsewhere) may be derived from the table by subtraction.

Percentage of N. C. live births occurring in area Number of live births occurring in area Number of live births occurring in N. C.

Percentage of area live births occurring to residents of area Number of resident live births occurring in area X 100 births occurring in area

8. Perinatal Deaths

Perinatal deaths are the sum of registered fetal deaths and neonatal deaths (see definitions below). The perinatal mortality rate is the number of resident perinatal deaths per 1000 resident deliveries (live births plus fetal deaths).

Perinatal mortality rate = Number of fetal deaths plus

number of neonatal deaths
Number of live births plus
number of fetal deaths

9. Fetal Deaths

A fetal death is death prior to the complete expulsion or extraction from its mother of a product of human conception, irrespective of the duration of pregnancy, as indicated by the fact that after such expulsion or extraction the fetus does not breathe or show any evidence of life, such as beating of the heart, pulsation of the umbilical cord, or definite movement of voluntary muscles. (Definition adopted by World Health Organization in 1950.) Consistent with North Carolina law, this report includes only fetal deaths which do not qualify as therapeutic abortions and which result from pregnancies of 20 or more weeks duration (see Section III).

The fetal mortality ratio (not calculated) is the number of fetal deaths per 1000 live births. The rate computed in the tables is the number of resident fetal deaths per 1000 resident deliveries (live births plus fetal deaths).

Fetal mortality rate = Number of fetal deaths Number of live births plus
Number of fetal deaths

Attendant

Computations are the percentage distribution of resident fetal deaths according to attendant.

Percentage of fetal deaths attended by physician in hospital	= Number of fetal deaths = attended by physician in hospital Number of fetal deaths	Χ	100
Percentage of fetal deaths attended by physician not in hospital	Number of fetal deaths attended by physician not in hospital Number of fetal deaths	Χ	100
Percentage of fetal deaths attended by midwife and other	Number of fetal deaths attended by midwife and other Number of fetal deaths	Χ	100

Out of Wedlock

Resident fetal deaths which occurred out of wedlock are shown as a percentage of total resident fetal deaths. There were no cases of unknown marital status included in the denominator of the rate.

Illegitimate rate
specific for fetal deaths = Number of fetal deaths
occurring out of wedlock
Number of fetal deaths X 100

10. Neonatal Deaths

A neonatal death is death of a live born child under 28 days of age. The neonatal mortality rate is resident neonatal deaths per 1000 resident live births.

Neonatal mortality rate = $\frac{\text{Number of neonatal deaths}}{\text{Number of live births}} \times 1000$

11. Postneonatal Deaths

Postneonatal deaths are deaths of infants 28 days and over but less than 1 year of age. These resident deaths are related to infants exposed to the risk of dying during the period, i.e., live births minus neonatal deaths. The rate is per 1000 resident neonatal survivors.

Postneonatal mortality rate = Number of postneonatal deaths Number of live births minus number of neonatal deaths

12. Infant Deaths

An infant death is defined as death of a live born infant under one year of age. The rate is resident infant deaths per 1000 resident live births.

Infant mortality rate = $\frac{\text{Number of infant deaths}}{\text{Number of live births}} \times 1000$

13. Deaths

Death is defined as the permanent disappearance of any evidence of life at any time after live birth (13). This definition excludes fetal deaths. The crude death rate and death rates specific for sex are computed for resident deaths.

Death rate (crude)	= Number of deaths Population of area X 1000)
Death rate specific for males	= Number of male deaths X 1000 Male population of area)
Death rate specific for females	= Number of female deaths Female population of area X 1000)

14. Age at Death

Age-specific death rates are based on reported age in completed years as of the last birthday. Errors in reporting are believed to include underestimates for ages 22 through middle age and overestimates for persons nearing their 21st and 65th birthdays and for those over age 65. Preferences for ages ending in certain digits (e.g., ages ending in 0 and 5) may also result in undue concentrations of reported ages (15).

In this report, age-specific death rates are calculated for 10-year age intervals. The age-specific death rates are resident deaths in the age group per 1000 population in the age group.

 $\begin{array}{c} \text{Death rate} \\ \text{specific for age} \end{array} = \frac{\text{Number of deaths in age group}}{\text{Population in age group}} \hspace{0.1cm} \text{X 1000} \end{array}$

15. Place of Death

Computations are the percentage distribution of resident deaths according to place of death.

Percentage of deaths occurring in hospitals	=	in hospitals Number of deaths	X 100
Percentage of deaths occurring in other institutions	=	Number of deaths in other institutions Number of deaths	X 100

Percentage of deaths occurring in home or non-institutions = $\frac{\text{Number of deaths in home or non-institutions}}{\text{Number of deaths}} \ \text{X 100}$

16. Occurrence Deaths

Deaths occurring in an area are shown as a percentage of deaths occurring in the State. Deaths occurring in the area to residents of the area are shown as a percentage of the total deaths occurring in the area. Complementary totals (i.e., non-resident deaths occurring in the area and resident deaths occurring elsewhere) may be derived from the table by subtraction.

Percentage of area deaths occurring to residents of area = Number of resident deaths occurring in area X 100 occurring in area

17. Marriages

North Carolina law defines marriage as the legal union of a male and a female (G.S. 51-1). The marriage rate of this report is the number of marriages occurring in an area per 1000 population of the area. Due to some cases of dissimilar races of the bride and groom ("mixed" marriages) and to a number of "not stated" race cases, frequencies and rates are shown only for the total.

Marriage rate (crude) = $\frac{\text{Number of marriages}}{\text{Population of area}} \times 1000$

18. Divorces and Annulments

Legal divorce or annulment can occur only by decree of an authorized court. Annulments, which void marriage from the beginning, constitute less than one percent of the sum of these events. A divorce from bed and board is a judicial separation suspending cohabitation but not otherwise affecting the marriage bond. Divorces from bed and board are not included in this report.

Due to a large number of cases in which race is not stated, frequencies and rates are shown only for the total. The divorce rate of this report is the number of divorces occurring in the area per 1000 population of the area.

Other Definitions

URBAN population is the population residing in urbanized areas and places of 2,500 or more population in 1970.

NET MIGRATION is the difference between the 1970 Census (2) and the expected population on April 1, 1970. Expected population is obtained by adding natural increase for the period April 1, 1960 through March 31, 1970 to the 1960 Census (1). The percentage increase or decrease represents the ratio of net migration to the population enumerated April 1, 1960 (1).
